

Asymptotics

1. Comparing functions Determine the asymptotic relationships between each pair of functions f and g in the following table (i.e. whether $f \in \mathcal{O}(g)$, $f \in \Omega(g)$ or $f = \Theta(g)$).

	$f(n)$	$g(n)$	\mathcal{O}	Ω	Θ
(1)	$n^2 - 30n + 5$	$0.7n^2 - 20n + 15$	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
(2)	$100n^3 + 40n^2 - n$	$0.5n^4 - 1000n^3$	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
(3)	$5n^2 - n$	$30n + 4$	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
(4)	n	\sqrt{n}	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
(5)	$n^{\frac{3}{4}}$	\sqrt{n}	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
(6)	$\log_2 n$	$\ln n$	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
(7)	$n(\log_2 n)^5$	$n\sqrt{n}$	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
(8)	2^n	2^{2n}	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
(9)	e^n	2^n	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
(10)	$n!$	n^n	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
(11)	$n!$	2^n	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
(12)	2^n	2^{n+1}	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

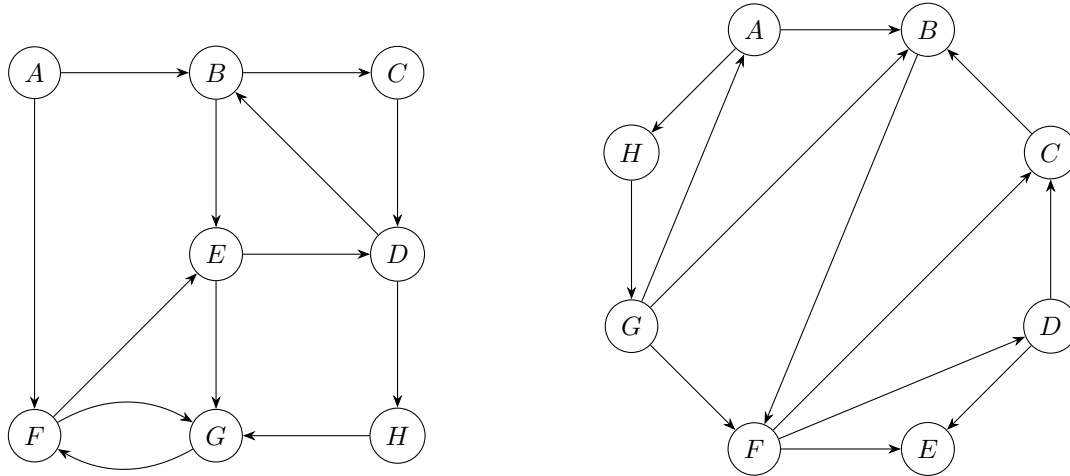

2. Properties of asymptotic notation Let $f(n)$ and $g(n)$ be asymptotically positive functions (which means that $\lim_{n \rightarrow \infty} f(n) > 0$ and $\lim_{n \rightarrow \infty} g(n) > 0$). Prove or disprove each of the following conjectures

1. $f(n) + g(n) \in \Theta(\min(f(n), g(n)))$.
2. $f(n) + g(n) \in \Theta(\max(f(n), g(n)))$.
3. $f(n) \in \mathcal{O}((f(n))^2)$.
4. $f(n) \in \Omega((f(n))^2)$.
5. $f(n) \in \mathcal{O}(g(n))$ implies $g(n) \in \Omega(f(n))$.

Interlude: Bridges. Jamie will demo an algorithm for finding “bridges” in undirected graphs. See page 122 of <https://iuuk.mff.cuni.cz/koutecky/pruvodce-en-wip.pdf> for a reference. Note that translation of this document into English is still a work in progress.

Depth First Search

3. DFS Runs Perform depth-first search on each of the following graphs; whenever there's a choice of vertices, pick the one that is alphabetically first. Classify each edge as a tree, forward, back or cross edge.

4. Singly Connected Graphs A directed graph G is *singly connected* if for every pair of vertices u and v there is at most one path from u to v in G . Give an efficient algorithm to determine whether or not a directed graph is singly connected.

5. Longest Path In a DAG Given a directed, acyclic graph (DAG) $G = (V, E)$ and two of its vertices s and t , we want to compute the length of a longest path from s to t .

6. Count Paths In a DAG Given a DAG $G = (V, E)$ and two of its vertices s and t , design an algorithm that calculates the number of distinct paths from s to t .
